Taxing the Digital Economy

Why this book?

As the OECD puts it, the digital economy is increasingly becoming the economy itself. Since this new economy comes with challenges for tax policymakers, the OECD published the consultation document “Addressing the tax challenges of the digitalisation of the economy”, which outlines different policy options to address these challenges. In June 2018, the Amsterdam Centre for Tax Law and IBFD hosted a two-day conference, where speakers from all over the world shared their views on these various options for taxing the digital economy.

This book contains the papers written in connection with this conference. It summarizes the insights from the conference and discusses recent policy developments on the taxation of the digital economy. Different aspects of the taxation of the digital economy, from value creation to significant digital presence to the digital services tax, are addressed by renowned academics and distinguished scholars.

In offering insight into all the different aspects of the taxation of the digital economy, this book aims to provide an overview of the (consequences of) various tax policy options to address the digital economy. In particular, it is hoped that it contributes to the discussion on resolving the tax challenges arising from the digitalization of the economy.

Title:	Taxing the Digital Economy
Subtitle:	The EU Proposals and Other Insights
Editor(s):	Pasquale Pistone, Dennis Weber
Date of publication:	August 2019
ISBN:	978-90-8722-558-2 (print/online), 978-90-8722-560-5 (ePub), 978-90-8722-559-9 (PDF)
Type of publication:	Book
Number of pages:	356
Terms:	Shipping fees apply. Shipping information is available on our website
Price (print/online):	EUR 95 / USD 115 (VAT excl.)
Price (eBook: ePub or PDF):	EUR 76 / USD 92 (VAT excl.)

Order information

To order the book, please visit www.ibfd.org/IBFD-Products/shop. You can purchase a copy of the book by means of your credit card, or on the basis of an invoice. Our books encompass a wide variety of topics, and are available in one or more of the following formats:

- IBFD Print books
- IBFD eBooks – downloadable on a variety of electronic devices
- IBFD Online books – accessible online through the IBFD Tax Research Platform

Foreword

xv

Part 1 Value Creation

Chapter 1: OECD Consultations on the Digital Economy: “Tax Base Reallocation” and “I’ll Tax If You Don’t”? 3

1.1.	Introduction	3
1.2.	Corporate tax systems have become outdated	5
1.3.	BEPS action package seems not to be enough	6
1.4.	Solutions in the consultation document: Two-pronged approach	8
1.5.	Transfer pricing? Or formulary apportionment, after all?	9
1.6.	GLOBE: A “BEPS 2.0”?	13
1.7.	Levying extra tax then, like the Americans? That means the end of import neutrality	14
1.8.	So what exactly are the Americans doing?	19
1.9.	Could other countries actually do that too?	22
1.10.	And so, lastly, what would be a better way forward?	23

Chapter 2: Transfer Pricing for Data Businesses: How to Apply the Arm’s Length Principle to the Digital Economy 27

2.1.	Introduction	27
2.2.	Tax challenges of the digital economy and recent policy developments	29
2.2.1.	Overview of tax challenges of the digital economy	29
2.2.2.	Recent developments at the OECD and proposals by the European Commission	30
2.2.3.	Critical review of the current debate	32
2.3.	Value creation in the digital economy and data-driven businesses	38
2.3.1.	Conceptual considerations on the usage of big data in business models	38
2.3.2.	Data mining process in business models	41

2.3.3.	Functional analysis of digital business models for transfer pricing	44
2.4.	Conclusions	46
Chapter 3:	User Contribution to Value Creation: The Benefit Principle in the Spotlight	49
3.1.	Introduction	49
3.2.	The benefit principle	52
3.2.1.	Benefit principle as the basis for source-based taxation	52
3.2.2.	Benefit theory in a domestic setting	54
3.2.3.	Benefit theory in an international setting	56
3.3.	User contribution to value creation: Some considerations	62
3.4.	Benefit principle considerations and users as a new nexus	65
3.5.	Conclusion	68
Chapter 4:	Taxation of the Digital Economy: A New Dawn for Multilateralism and Mutual Recognition	71
4.1.	Introduction	71
4.2.	The crisis of the territoriality principle on taxation of business profits in the digital era	71
4.3.	Reconsidering value creation: The OECD approach	75
4.4.	A new perspective on value creation: Value co-creation	77
4.5.	Reshaping the international tax framework through a mechanism of mutual recognition	83
4.6.	Conclusion	87
Part 2		
Significant Digital Presence		
Chapter 5:	New Nexus for the Digital Economy: An Analysis of Digital, Revenue-Based and User-Based Factors	91
5.1.	Introduction	91
5.2.	The quest for new income tax nexus for digital economy: Framing the policy discussion	95

5.2.1.	Clearing the theoretical mist: Tax equity, value creation, economic allegiance and justification to tax	97
5.2.2.	The Gordian knot: Justification to tax, physical presence and the market	99
5.2.3.	A view through the looking-glass: Territorial income tax jurisdiction and the problem of localization in the digital realm	102
5.3.	Redefining taxable presence for the digital age: An overview and assessment of some new proposals	107
5.3.1.	SDP as proposed by the European Commission	108
5.3.2.	Notion of SEP under Indian domestic law	110
5.3.3.	SEP in Israeli domestic law	111
5.3.4.	Assessment	112
5.4.	Conclusion	117
Chapter 6: Solving the Allocation of Taxing Rights Debate for the Digitalized Economy: Shortcomings of the Digital PE Proposal and Reconsideration of the Base-Eroding Payments Proposal		119
6.1.	Introduction	119
6.1.1.	Key characteristics of digital businesses and their corresponding tax challenges	119
6.1.2.	The response of international organizations and unilateral measures in the domestic tax law	122
6.1.2.1.	The response of international organizations	122
6.1.2.2.	Unilateral measures in the domestic tax law	124
6.1.3.	The purpose of this chapter	125
6.2.	The shortcomings of the digital PE concept	125
6.2.1.	The structure of this section	125
6.2.2.	BEPS Action 8-10: Profit allocation under the ALP	126
6.2.2.1.	Control over risk and ownership of intangibles (DEMPE activities)	126
6.2.2.2.	The transactional profit split method (PSM)	128
6.2.2.3.	Application of the PSM to digitalized businesses – Selected illustrations	129

6.2.3.	BEPS Action 7: Transactions between head office and PEs	130
6.2.3.1.	Changes to the PE threshold	130
6.2.3.2.	Profit allocation to PEs: Arm's length and non-arm's length approaches	131
6.2.3.3.	Application of the changes (including PSM) to digitalized businesses – Selected illustrations	132
6.2.4.	Lessons from BEPS Actions 8-10 and Action 7: Enhanced profit allocation to the source (market) states and tax uncertainty	136
6.2.5.	The digital PE proposal	138
6.2.5.1.	New nexus rules	138
6.2.5.2.	New profit allocation rules	139
6.2.5.3.	Our perspective on whether an EU SDP-type proposal should be pursued?	140
6.3.	A WHT on services as a rational long-term solution	144
6.3.1.	Introductory comments	144
6.3.2.	A stand-alone final WHT	145
6.3.3.	A broad WHT with pragmatic restrictions: A WHT on all business-to-business services	145
6.3.4.	A creditable WHT on cross-border and domestic services	148
6.3.5.	A WHT on gross payments for services	150
6.3.6.	A simple and therefore easily enforceable WHT	152
6.3.7.	A WHT compliant with international obligations	155
6.4.	Conclusion	157

Part 3

EU Digital Services Tax

Chapter 7:	Unilateralism in Taxing the Digitalized Economy: Comparing the EU Digital Services Tax Proposal and the Indian Equalization Levy	161
7.1.	Introduction	161
7.2.	Object, purpose and legal basis	162
7.3.	Taxable revenues and taxable person	166
7.3.1.	Taxable revenues	166
7.3.2.	Taxable person	168
7.4.	Place of taxation and revenue allocation	170

7.5.	Interaction between the measures: A case study	172
7.6.	Concluding remarks	174
Chapter 8: Comments on the Digital Services Tax: A Panacea or Placebo for the Taxation of the Digital Economy?		177
8.1.	Introduction	177
8.2.	Setting the scene	179
8.2.1.	The tax challenges of the digital economy	179
8.2.1.1.	Cross-jurisdictional scale without mass	180
8.2.1.2.	Reliance upon intangible assets	181
8.2.1.3.	Data and user participation	181
8.2.2.	The digital services tax proposal	184
8.2.2.1.	Material scope	184
8.2.2.2.	Subjective scope	186
8.2.2.3.	Territorial scope	187
8.2.2.4.	Chargeability and rate	188
8.3.	The DST as panacea, a remedy to the tax challenges of the digital economy in the EU and global tax framework	189
8.3.1.	Meeting the objectives of the DST	189
8.3.2.	The DST and the principle of non-discrimination	192
8.3.3.	The DST and DTCs	195
8.4.	The DST as a placebo, a flawed proposal in light of certain tax principles	199
8.4.1.	Issues under the principle of equity	200
8.4.2.	Issues under the principle of neutrality	201
8.4.3.	Issues under principles of international tax law	203
8.5.	Conclusion	208
Chapter 9: Some Critical Remarks about the DST Proposal		211
9.1.	Introduction	211
9.2.	Behind the DST Proposal	211
9.2.1.	The general picture	211
9.2.2.	The phenomenon of stateless/taxless income	212
9.2.3.	The digital tax package	214
9.3.	The DST Proposal	214
9.3.1.	The basic rules	215
9.3.2.	The targeted outcome	215
9.3.3.	Areas with potential for improvement	216
9.3.3.1.	The temporary character of the DST Proposal	216

9.3.3.2.	Limited scope	217
9.3.3.3.	User location – Tax allocation	220
9.3.4.	The ongoing discussion – Key developments	221
9.4.	Conclusion: An international policy perspective	223
 Chapter 10: Digital Services Tax: A Critical Analysis and Comparison with the VAT System		 225
10.1.	Introduction	225
10.2.	Key features of the DST and comparison with the VAT system (and other indirect taxes where relevant)	227
10.2.1.	Overall objective of the tax	227
10.2.2.	Taxable revenue	229
10.2.2.1.	Tax base	229
10.2.2.2.	Taxable amount	231
10.2.2.3.	Intra-group transactions	231
10.2.3.	Taxable persons	232
10.2.4.	Taxable rate	233
10.2.5.	Place of taxation	233
10.2.6.	Remitting of the tax	236
10.2.7.	Time limit	237
10.2.8.	Summary and brief comments regarding overall compliance with the general tax principles	238
10.3.	Is the DST an indirect tax at all?	240
10.4.	Recent developments: National initiatives	241
10.5.	Conclusions	243
 Chapter 11: The Compatibility of the EU Digital Services Tax with EU and WTO Law: <i>Requiem Aeternam Donate Nascenti Tributo</i>		 247
11.1.	Introduction	247
11.2.	Rationale behind the Commission’s intervention in this area	249
11.3.	Main features of the DST	251
11.4.	Compatibility with EU law	253
11.4.1.	Introduction	253
11.4.2.	Compatibility with State aid rules	254
11.4.3.	Compatibility with fundamental freedoms	256

11.4.3.1.	Scope of fundamental freedoms and the EU Commission proposal	256
11.4.3.2.	Restriction	257
11.4.3.2.1.	The deduction system	257
11.4.3.2.2.	Worse treatment of non-EU service providers	258
11.4.3.3.	Justifications and proportionality	261
11.4.3.3.1.	Regarding the deduction system	261
11.4.3.3.2.	Regarding de facto discrimination	263
11.4.4.	Fulfilment of the requirements connected with the DST's legal basis	264
11.4.4.1.	Introduction	264
11.4.4.2.	DST in the case of profits: The emergence of the market state	264
11.4.4.3.	Internal market	267
11.4.4.4.	Avoid distortion of competition	271
11.4.5.	Subsidiarity and proportionality	273
11.4.5.1.	Introduction	273
11.4.5.2.	Subsidiarity and a gap in the effective average tax rates	274
11.4.5.3.	Proportionality and less restrictive approaches	276
11.5.	Compatibility with WTO law	278
11.5.1.	Introduction	278
11.5.2.	Covered digital services and WTO schedules	279
11.5.2.1.	Advertisement services	279
11.5.2.2.	Other services	281
11.5.3.	Discrimination	282
11.5.3.1.	De facto discrimination created by the threshold	282
11.5.3.2.	Compatibility of the deduction system stated in the preamble	283
11.5.4.	Exceptions to the national treatment clause	284
11.6.	Conclusions	285

Foreword

The first industrial revolution began in the early 18th century and laid the foundations of the economy as we know it today. It brought significant social changes and resulted in an increase in population and the phenomenon of urbanization. In the late 19th century, the second industrial revolution started when the first mass production started and assembly lines were introduced. This revolution changed the foundations laid by the first revolution and reshaped our economy. Now, a third (some say fourth) revolution is under way with the digitalization of the economy and, as the OECD puts it, the digital economy is increasingly becoming the economy itself.

The rapid technological progress that has characterized the digital economy has led to a number of challenges for tax policymakers in the near future. The OECD identified these challenges and developed measures to prevent extensive base erosion and profit shifting (BEPS) in their BEPS Action Plan. The European Commission, inspired by the BEPS Action Plan, proposed two Council Directives on 21 March 2018: (i) the taxation of profits based on a corporation's significant digital presence; and (2) a common system for a digital services tax. Both proposals ultimately aim at the attribution of taxing rights to the jurisdiction where users are located. In the beginning of 2019, the OECD published the public consultation document "Addressing the tax challenges of the digitalization of the economy". The consultation document outlines different policy options addressing the tax challenges posed by the increasing digitalization of the economy.

To discuss the challenges of the digital economy and the proposed measures, the Amsterdam Centre for Tax Law and IBFD jointly hosted a conference titled "Taxing the digital economy: the way ahead" on 28 and 29 June 2018 in Amsterdam, the Netherlands. During this conference, speakers from all over the world shared their views on the various options for taxing the digital economy. Renowned academics and distinguished scholars discussed the ideas from the OECD/G20 and the published proposals of the European Union during the conference.

This book summarizes the insights from the conference and discusses recent policy developments on the taxation of the digital economy. Additionally, the book contains a compilation of papers that were written following the panels and discussions that took place during the conference.

On behalf of the Amsterdam Centre for Tax Law and IBFD, we extend our thanks and appreciation to the speakers for their contribution to the discussions and to Juan Manuel Vázquez for reviewing the proofs.

Chapter 4

Taxation of the Digital Economy: A New Dawn for Multilateralism and Mutual Recognition

Mattia Calabrese

4.1. Introduction

The digital economy has changed the way in which enterprises are operating through a radical reshaping of value chains and markets. This phenomenon is directly connected with the question of whether the digital economy has also had an impact on how value is created, leading to a misalignment between taxation and value creation. The purpose of this chapter is to show that the principle currently used to tax business profits, i.e. where the value is created, is actually connected to only one of the several managerial theories explaining value creation. However, if other approaches are considered, they should at least be contextualized, e.g. in light of the so-called service-dominant (S-D) theories of value creation that are receiving more and more consensus in the managerial literature. Finally, the chapter will show how the S-D logic of value creation might be used to reshape the international tax framework following a pattern of multilateralism and mutual recognition.

4.2. The crisis of the territoriality principle on taxation of business profits in the digital era

The current framework of international taxation is pinned on a duality in the attribution of taxing rights: on one side, there is the residence state, entitled to tax the worldwide income generated by companies on the basis of the presence in its territory of the place of effective management (POEM) or because the company has been incorporated under its law; on the other side, there is the source state, which can levy taxes only on the income generated in its territory. With this background, the territoriality principle can be seen as the principle of imposing taxes only within the territorial jurisdiction of a sovereign state. In this sense, the sovereignty of a state can be measured by its ability to possess and effectuate tax jurisdiction over all income arising

within its territory without external limitations.¹ The residence state, in particular, considers the worldwide income of the enterprise to have a strong attachment with its territory because of the fulfilment of predetermined criteria like incorporation or POEM, allowing it to exercise its sovereignty on the entire amount of this income; by contrast, the source state limits its sovereignty to only the income generated in its territory.

As regards business profits, in the literature it has been stated that source state taxation is justified only by an economic attachment between the generation of income and the territory of the state, which means that the income not only should have a geographic connection seeking to assert source jurisdiction, but that attachment must also be economic, namely the income must be produced in that territory.² According to Kemmeren, that type of production can only be the result of human activities because only individuals can create income, whereas things in themselves cannot. Therefore, the intellectual element is the key component in the production of income because only through the actions of an individual may value be added to something.³

In the OECD Model, this interaction between residence and source states is clearly described in article 7, which asserts that the profits of an enterprise can be taxed only in the residence state, unless the enterprise has a permanent establishment (PE) in the other contracting state. In addition, the latter is allowed to tax only so much of the profits attributable to the PE located in its territory as if the PE were “a separate and independent enterprise engaged in the same or similar activities under the same or similar conditions, taking into account the functions performed, assets used and risks assumed by the enterprise through the permanent establishment and through the other parts of the enterprise”.⁴

Nonetheless, the wording of article 7 is not sufficient for finding a connection through which the profits generated between different parts of the same economic operator can be apportioned. The OECD, in line with the origin theory, has developed widely accepted standards that adopt a supply-centric theory of value creation. The origin theory qualifies enterprises as the only entities capable of generating value and, within the enterprise, the main

source of value creation can be identified in the functions that people working for the enterprise perform, especially those related to risk management, which can be deemed to comprise three elements:

(i) the capability to make decisions to take on, lay off, or decline a risk-bearing opportunity, together with the actual performance of that decision-making function, (ii) the capability to make decisions on whether and how to respond to the risks associated with the opportunity, together with the actual performance of that decision-making function, and (iii) the capability to mitigate risk, that is the capability to take measures that affect risk outcomes, together with the actual performance of such risk mitigation.⁵

What is more, in order to benchmark the PE against other independent enterprises, the OECD developed the Authorised OECD Approach (AOA), which splits the analysis into two parts:

first, a functional and factual analysis, conducted in accordance with the guidance found in the Guidelines, must be performed in order to hypothesise appropriately the PE and the remainder of the enterprise (or a segment or segments thereof) as if they were associated enterprises, each undertaking functions, owning and/or using assets, assuming risks, and entering into dealings with each other and transactions with other related and unrelated enterprises. Under the first step, the functional and factual analysis must identify the economically significant activities and responsibilities undertaken by the PE. This analysis should, to the extent relevant, consider the PE's activities and responsibilities in the context of the activities and responsibilities undertaken by the enterprise as a whole, particularly those parts of the enterprise that engage in dealings with the PE. Under the second step, the remuneration of any dealings between the hypothesised enterprises is determined by applying by analogy the Article 9 transfer pricing tools (as articulated in the Guidelines for separate enterprises) by reference to the functions performed, assets used and risk assumed by the hypothesised enterprises. The result of these two steps will be to allow the calculation of the profits (or losses) of the PE from all its activities, including transactions with other unrelated enterprises, transactions with related enterprises (with direct application of the Guidelines) and dealings with other parts of the enterprise (under step 2 of the authorised OECD approach).⁶

However, with the rise of the digital economy, companies are not obliged anymore to keep a physical connection with the destination state to ensure the sale of their products in the market of that state. Therefore, the digital economy has created a discrepancy where even though a company is

interacting with users or customers located in a state, that company has no functions, assets or risks geolocated therein. As a result, no taxable profits can be attributed to that state under the current international tax framework. Moreover, due to the so-called scale without mass,⁷ this discrepancy is creating a sense of unfairness in the public, which perceives a “tax gap”,⁸ resulting in strong political tensions.

The main obstacle to moving forward is, apparently, the current versions of tax treaties following the OECD Model, which limit source taxation only to cases in which a PE is deemed to exist. Article 5 of the OECD Model defines a PE as a fixed place of business through which the activities of the enterprise are wholly or partly carried on.⁹ Hence, the lack of physical presence in the territory of the state hampers the introduction of any possible fiscal measure capturing the profits realized by foreign enterprises. For this reason, the PE definition seems to be more of a cage¹⁰ than a threshold for ensuring neutrality and fairness.¹¹

Since the definition of a PE has been perceived as a thorny obstacle to eliminate, some scholars,¹² the European Commission¹³ and the OECD¹⁴ have presented brand new definitions of a digital PE. All these definitions focus on the value generated by factors of production external to the sphere of the enterprise, seen as an aggregation of functions, assets and risks, entailing a shift from a supply-centric view to a reconceptualization of value creation that takes into account also demand factors.¹⁵

4.3. Reconsidering value creation: The OECD approach

In the Interim Report “Tax Challenges Arising from Digitalisation”, the OECD focused on analysing new theories of value creation that could be used to make a proper evaluation of the tax measures to be introduced to “realign” taxation and value creation in the digital era. The starting point was that the process of value creation has substantially changed, especially for digitalized businesses having in common the following characteristics:

- cross-jurisdictional scale without mass, meaning that digitalized enterprises can be involved in the economic life of a country without having any physical presence in its territory;
- reliance on intangible assets, including IP, as they are essential to support digital platforms, websites and many other functions that are central to the business model; and
- data, user participation and their synergies with IP, as most of the social networks could not exist without data, network effects and user-generated content.¹⁶

Companies with such characteristics are competing in the so-called digital market, which also has peculiar features in comparison to the other ones, namely

- direct network effects, where the utility from the consumption of a specific good or service is dependent on the number of other end-users consuming the same good or service;
- indirect network effects that arise in a multisided contest in which a specific group of end-users benefit from interacting with another group of end-users via the digital platform;
- economies of scale due to the prevalence of fixed costs over variable ones;
- switching costs and lock-in effects caused by the dependence on an operating system, which may render difficult switching to another one; and
- complementarity of the goods sold in different markets.

The result of these peculiarities is that, in each digital market, only or almost only a single firm can exist, and it would be strong enough to influence market prices.¹⁷ What is more, transactions with end-users can be concluded in a very short amount of time, decreasing the time required to develop new products, share ideas, create new markets, and identify, engage and develop

16. OECD/G20, *Interim Report 2018*, *supra* n. 7, at pp. 24-25.

17. *Id.*, at pp. 26-28.

new customer bases.¹⁸ Then, the possibility of having cross-jurisdictional networks through the use of the Internet has improved the way in which multisided markets work and has contributed to creating “barter transactions” where valuable services are exchanged for other inputs, such as data.¹⁹

Under this backdrop, the OECD tries to test the old theories of value creation. In particular, a criticism of Porter’s value chain analysis has been made, stating that it does not consider the information flow as an asset capable of generating a competitive advantage; the theory was originally designed to be applied to domestic firms and not to MNEs; the theory is not applicable to services due to the lack of inputs being transformed into outputs.²⁰ For this reason, two further theories of value creation are presented: the value network and the value shop.

The value network sees the network as a critical determinant of value creation, generated from the actions of linking the organization with and facilitating exchange between users.²¹ Companies trying to build a value network will focus, *inter alia*, on attracting and selecting users; establishing, maintaining and terminating links between users; and maintaining and running a physical and information infrastructure.²²

On the other hand, the value shop operates in single-sided markets and is characterized by the usage of an intensive technology applied to solve customers’ problems.²³ A value shop is comprised of five primary activities, namely:

- problem finding and acquisition, where the problems to be solved are recorded, reviewed and formulated;
- problem solving, in which different alternatives are found and evaluated;
- choice, comprising all the activities connected with the identification of the best solution;
- execution, where the solution is communicated, organized and implemented; and
- control and evaluation, which measures to what extent the initial problem has been solved.²⁴

21. *Id.*, at p. 38.

22. *Id.*, at p. 39.

23. *Id.*, at p. 40.

24. *Id.*, at p. 41.

Finally, the OECD clarifies that, even though in all the sections describing value creation a reference has been made to business models, it would be better to use the term “business lines”, as most of the time companies take advantage of the complementarity between different business initiatives and, hence, can make use of different business lines at the same time. For instance, Amazon’s retail business is consistent with the value network, whereas Amazon’s web services are in line with the value shop.²⁵

However, the states comprising the Inclusive Framework have different opinions on whether data and user participation can contribute to value creation. Some members consider the role of user participation to be an important value driver, especially for its capacity to generate network effects; still others consider the exchange between the services provided by the companies and the data disclosed by the users as a mere transaction, incapable of entailing the attribution of taxing rights to the states where the users are located. Nonetheless, in the latter case, some countries view user participation and data as potentially giving rise to valuable intangibles, entailing further analysis in the process of value creation.²⁶ In the author’s opinion, the different positions taken by the states are the reflection of a never-ending diatribe in the managerial literature that, as the next sections outline, could be either the trigger of a tax war in the allocation of taxing rights, implying serious risks of double taxation, or, as the author wishes, the dawn of a new way of conceiving international taxation based on multilateralism and mutual recognition.

4.4. A new perspective on value creation: Value co-creation

The origin principle starts from the assumption that the generation of profits by companies can only be the result of functions performed by people working for the company. This perspective, considering the changes in the value chains presented by the OECD, may lead one to wonder what the impact on the concept of value creation might be. In other words, are the changes in how the value chain is structured affecting how value is generated by companies?

In the author’s opinion, the answer is no. The fact that companies are structuring their business in different ways does not rule out the possibility of

25. Id., at p. 42.

26. Id., at pp. 25-26.

carrying out an analysis based on where the functions performed by people on behalf of the company are located. For instance, the crucial role of users in the profitability of the social network does not affect the validity of an assumption that the success of the digital platform depends on the functions performed by people for the company. In fact, without developing and marketing a product capable of appealing to users and creating a strong attachment, it would not be possible to reach a huge success in the market so as to assume a monopolistic position. Following this reasoning, value can still be deemed to be generated where the functions are performed.

In addition, even considering old-fashioned business models, companies could not have been successful on the market and could not have generated any profit without having clients ready to purchase the product offered at the price asked by the company. According to this view, the necessity for the company to develop a product that is “welcomed” within a market has always been the main objective for the generation of value/profits.

This concept can be explained even better using a metaphor related to the survival of human beings. It is a fact that human beings need food to survive and grow strong. In ancient times, humans used to eat vegetables growing in the wild without external intervention and hunt animals to gather the food they needed to satisfy their needs. Today, people are using technologically advanced cultivation methods to provide all the vegetables they need and are breeding animals to ensure a sufficient amount of meat for society. In other words, the evolution of the activities performed to get food does not affect the necessity of eating for humans to survive. The same reasoning might be applied to companies and the digital economy: the technological improvements achieved through digitalization and new business models represent only new tools that can be used to get to the final purpose that companies pursue to exist: value creation.

As a result, the first outcome of this chapter is that value creation and the structuring of the value chain are two concepts that should be kept separate: value creation should be understood as the capability of a company to use factors of production generating outputs that have higher returns than the costs borne by the company in the process of realizing those outputs; by contrast, the structuring of the value chain is just a tool, created by managerial decisions willing to exploit the possibilities offered by the current technologies to maximize the value generated in terms of positive differentials between revenue and costs. Consequently, the Report presented by the OECD only outlines the current tools used by companies to get to value creation, but does not explain why, in the modern age, the place where the

functions are performed is no longer capable of capturing the value generated. In other words, the OECD does not explain why transfer pricing is not capable of aligning taxation and value creation in the digital era.

However, it is necessary to underline that the framework used to explain the generation of value and justify the possibility for a state to levy taxes on the profits generated in its territory is not aligned with an influential managerial doctrine that is trying to explain value creation on the basis of the so-called S-D logic as opposed to the goods-dominant (G-D) logic. In particular, the G-D logic, as can be easily understood from the previous assertions, is based on the value-in-exchange meaning of value where value is created (manufactured) by the firm and distributed in the market through the exchange of goods and money. From this perspective, the roles of “producers” and “consumers” should be kept separate, and value creation should be understood as a series of activities performed by the firm.²⁷ On the contrary, S-D logic is linked to the value-in-use meaning of value where the roles of producers and consumers are not distinct, meaning that value is always co-created, jointly and reciprocally, in interactions among providers and beneficiaries through the integration of resources and application of competences, where the final outcome is to get a job done.²⁸ When value is perceived as value in use for the customer, the focus is no longer predominantly on a customized bundle of products or services exchanged for a price. Instead, value creation becomes an ongoing process that emphasizes the customer’s experiences, logic and ability to extract value from products and other resources used.²⁹

An example presented by Vargo et al. to explain this theory refers to the sale of an automobile in which a manufacturing company uses different raw materials, such as metal, plastic, rubber, etc., to generate the final product. According to the G-D logic, the firm’s production process creates value for customers through the manufacturing and delivery of the automobile. In this sense, value is created by the firm in the form of a good, and this valuable good is exchanged in the marketplace for money. Alternatively, pursuant to the S-D logic, the automobile is only an input into the value creation that occurs as customers use it and integrate it with other resources (e.g. the ability to drive). If the customer did not know how to drive, the automobile

would not have had any value. Consequently, it is only when customers satisfy their own needs through the use of the automobile that value is created, and this concept is at the basis of the so-called value co-creation where customers and firms are involved in a reciprocal and mutually beneficial relationship.³⁰

What is more, this theory can be logically extended not only to customers, but also to all the other actors interacting with the company. In fact, a company can be successful only if it is involved in a network of successful relationships with all its stakeholders, especially shareholders, banks, employees, suppliers, public authorities, and so on. Would it be possible to imagine the existence of a company without shareholders? Clearly it would not, because without people trusting in the success of a specific investment, that investment would never be made. This implies that, in an S-D logic, the company is exchanging resources with its shareholders not only in terms of capital for dividends, but also competences, acknowledgment of a higher social position, etc. Without the creation of a satisfactory balance between the parties, no value could be created. Would it be possible to imagine the existence of a company without banks? Probably not, because without the support of specific services provided by financial institutions, the management of inflows and outflows of money would be impossible. Again, in the S-D logic, there must be an exchange of resources leading to a satisfactory result for both parties in order for the company to operate in the market. Would it be possible to imagine the existence of a company without employees? No, because the company would be reduced to just an empty box, incapable of generating any value. Again, the company must ensure the creation of good relationships and exchange of resources to exist and be successful for several years. Would it be possible to imagine the existence of a company without all the authorizations required and, possibly, a relationship of trust with the public authorities? Even if criminal entities could carry out activities, their long-term survival would be impossible since, sooner or later, the state would take countermeasures to stop or hamper the entity from performing whatever activity.

Against this backdrop, it is clear that there might be potential conflicts of interest between companies and their stakeholders: for instance, when companies have to pay interest to a bank, dividends to shareholders or salaries to employees, they are subtracting financial resources from reinvestments in their activities. However, at the same time, companies cannot survive without the cooperation of those stakeholders. In the end, all the relationships

Mattia Calabrese holds a bachelor's degree in Economics and a master's degree (cum laude) in Business Administration, obtained from the Federico II University of Naples. He also holds an LLM in International Tax Law, having successfully completed the programme organized by the University of Amsterdam in cooperation with IBFD. Currently, he works for the University of Amsterdam as LLM tutoring assistant, as well as being involved in research activities related thereto.

Vikram Chand is currently the Executive Director of the Executive Programme in Transfer Pricing and Master of Advanced Studies in International Taxation at the University of Lausanne (UNIL), Switzerland. Additionally, he is a senior researcher and lecturer at the Tax Policy Center of UNIL. He is also an external training expert for the OECD's Global Relations Programme, pursuant to which he is mandated to train tax administrations around the world on international tax law topics. He can be reached via email at vikram.chand@unil.ch.

Stjepan Gadžo is an Assistant Professor at the University of Rijeka, Faculty of Law, where he first started working as a research assistant in 2011. In 2016, he received his PhD in Law from the University of Zagreb, Croatia. He has also held the position of a postdoctoral research fellow at IBFD Academic. His primary research interests relate to the allocation of the rights to tax cross-border business income, and he has also authored several articles and book chapters for Croatian and international publications. He can be reached via email at sgadzo@pravri.hr

Sriram Govind qualified as a lawyer in India and is a research and teaching associate at the Institute for Austrian and International Tax Law at WU (Vienna University of Economics and Business), where he is also pursuing his doctoral studies in the Doctoral Programme in International Business Taxation. His areas of expertise include tax treaty law, tax policy and dispute resolution in tax matters.

Charlène A. Herbain (PhD, Paris 1 Panthéon-Sorbonne, Luxembourg) is a senior managing lawyer in the tax policy and tax litigation practice at PwC Legal Brussels. She teaches VAT classes at various universities (UCL Belgium, University of Luxembourg and Université Nancy II France). She has been named as an Indirect Tax Leader (2014, 2015, 2017 and 2018) by

International Tax Review and received honourable mention from the jury of the IFA Maurice Lauré Prize 2015. She is also a case note editor for Intertax.

Vasiliki KoukoulIoti is a PhD researcher at the Centre for Commercial Law Studies, Queen Mary, University of London (QMUL) conducting research on the corporate income tax law implications of the digitalized economy, where she holds a Microsoft-funded scholarship. She is a qualified Greek attorney-at-law and has worked at PwC and law firms for more than 5 years providing tax advice and tax litigation services. Vasiliki has obtained an LLM in Tax Law from QMUL and an Advanced Diploma in International Taxation from the Chartered Institute of Taxation, London.

Marie Lamensch is Research Professor of International and European Tax Law at the Vrije Universiteit Brussel and visiting Professor at the Université Catholique de Louvain and the Katholieke Universiteit Leuven. Marie also serves as an appointed member of tax expert groups within the OECD and the European Commission and works as an external consultant on VAT cassation proceedings for a Belgium-based international law firm.

Paolo Ludovici founded L&P – Ludovici Piccone & Partners – in November 2014. He advises on all areas of tax law. His expertise includes domestic and international corporate reorganizations, mergers and acquisitions (M&A), structured finance, as well as real estate transactions. He is renowned for his expertise in advisory for high-net-worth individuals with particular reference to estate and succession planning, transfer of businesses, lifetime transfers assets and corporate governance. Paolo is consistently ranked by the most reputed independent researchers as a leading Italian tax professional. He has published a large number of papers on tax matters, regularly participates as a speaker at conferences and lectures in the field of taxation.

Christopher A. Ludwig studied business administration at the University of Mannheim and Bentley University in Boston, United States. His major fields of study were business taxation, accounting, and finance. In September 2017, he started the PhD programme at the University of Mannheim and in October 2018, he joined the Research Department “Corporate Taxation and Public Finance” of the Centre for European Economic Research (ZEW). He is particularly interested in international business taxation, tax planning and taxation in the era of digitalization.

Andrés Báez Moreno is Associate Professor of Tax Law at the Universidad Carlos III de Madrid, Spain, and a lawyer at the Madrid Bar. He has been

a visiting pre- and postdoctoral researcher at the University of Münster, the University of Cologne, the University of Padua at IBFD and the Max Planck Institute for Tax Law and Public Finance in Munich. His areas of expertise are domestic company taxation (in particular, commercial and tax accounting) and international taxation, fields in which he has published 2 books and more than 40 articles and contributions. He can be reached at andres.baez@uc3m.es.

Luís Flávio Neto is a postdoctoral research fellow at IBFD in the Netherlands, as well as a tax law professor at IBDT and USJT, both in Brazil. He is also a former judge at the highest administrative tax court of Brazil (CARF) and a member of the International Association of Tax Judges (IATJ). He holds an LLM and a PhD from the Universidade de São Paulo (USP), in Brazil.

João Félix Pinto Nogueira is Deputy Academic Chairman of IBFD. He is also team manager of IBFD Academic and Adjunct Editor-in-Chief of the World Tax Journal and of International Tax Studies. Dr Nogueira is also a board member of IFA Portugal, of IFA Europe and of the Latin American Institute of Tax Law (ILADT), besides being a member of IFA's PSC. He is Honorary Associate Professor at the University of Cape Town, South Africa, and lecturer at the Universidade Católica Portuguesa, Portugal. He can be contacted at j.nogueira@ibfd.org.

Marcel Olbert studied business administration at the University of Mannheim, the City University of Hong Kong and the University of St. Gallen. Since 2015, he has been a PhD student and a research assistant at the University of Mannheim. In 2018, he visited at Stanford University. His policy-related work focuses on taxation in the digital economy, and his current empirical research studies business groups in financial distress and tax considerations of private equity firms.

Steve Pierrée pursued a master in law at the University of Liège before completing an LLM degree in International and European Business Law at Trinity College Dublin, with a specific focus in tax law. In October 2019, he is starting his career as a Junior Associate at PwC Legal.

Pasquale Pistone is the Academic Chairman of IBFD in the Netherlands, as well as a holder of a Jean Monnet *ad personam* Chair in European Tax Law and Policy at WU (Vienna University of Economics and Business) in Austria. In addition, he is Professor *honoris causa* at the Ural State Law University and at the University of Cape Town, and Member of the

Executive Board and Secretary General of the European Association of Tax Law Professors. He is also Editor-in-Chief of the IBFD World Tax Journal and Doctoral Series, executive editor of the IBFD GTTC and co-editor of *Diritto e Pratica Tributaria Internazionale*.

Laura Simmonds currently works as a tax lawyer at the firm Bonn Steichen & Partners in Luxembourg. In 2018, she completed an LLM in International Tax at the University of Amsterdam in partnership with IBFD. Prior to this, she worked at the Court of the Justice of the European Union and at the OECD, where she participated in the work on the taxation of the digital economy.

Christoph Spengel is Professor in International Business Taxation at Mannheim University. He is a member of the Scientific Council of the Federal Ministry of Finance, Director and speaker of Leibniz ScientificCampus MaTax, Research Associate at the Centre for European Economic Research (ZEW) and International Research Fellow at Oxford University, Saïd Business School. He was also appointed as expert in taxation by the OECD, European Commission, IMF, German Federal Constitutional Court, German Federal Parliament and European Parliament.

Piergiorgio Valente is Professor in EU Tax Law, as well as Tax and Financial Planning, at the Link Campus University of Rome and the author of several volumes and papers on taxation. He is also President of CFE Tax Advisers Europe (2017-2020), Chairman of the International Tax Committee of the IAFEI and Member of the BIAC Committee on Taxation and Fiscal Policy. He is the founder and managing partner of the leading law firm Valente Associati GEB Partners/Crowe Valente.

Dennis Weber is Director of the Amsterdam Centre for Tax Law (ACTL) at the University of Amsterdam and Professor in European Corporate Taxation, with specialization in legal tech and anti-BEPS measures. He is also counsel at Loyens & Loeff.

Maarten de Wilde is a full Professor of International and European Tax Law at Erasmus School of Law (ESL), Erasmus University Rotterdam (EUR), the Netherlands. He is the head of the faculty's tax law department. Maarten also works as a tax adviser at Loyens & Loeff, Rotterdam and is associated with the Amsterdam-based Africa-Europe Partnership Institute for Capacity Building and Human Resource Development (AEPICAB). He can be reached via email at dewilde@law.eur.nl.

Ciska Wisman works at the Amsterdam Centre for Tax Law of the University of Amsterdam, the Netherlands, where she lectures on international and national tax law. She is performing PhD research with respect to the tax treatment of dividends within the European Union. In addition, Ciska works as a tax lawyer at Stibbe, the Netherlands. She can be contacted at c.wisman@uva.nl.
